

Executive summary

11 October 2023

Reported case rates for the week ending 08 October 2023 have increased compared to the week prior. In the week ending 01 October 2023, hospital admissions have remained relatively stable, and mortality has decreased compared to the previous week.

Genomics surveillance¹ data from 18 September to 02 October 2023 showed an XBB variant called EG.5 had been slowly growing. EG.5 made up 41% of all observed cases. EG.5 was the most common tracked variant, but its growth rate had slowed in the past few weeks. This could mean that other variants were becoming competitive with EG.5, or that EG.5 had reached its limit. The rest of the cases were primarily other XBB variants (33%), with a smaller portion attributed to XBC.1.3 (14%) and other recombinants (10%)². BA.2.86 variant was detected in wastewater monitoring.

² WGS relies on PCR samples, and COVID-19 testing prioritises PCR for hospital and care cases. This means the cases sequenced are not random, and they mostly involve older individuals.

Key insights

National Trends

Cases The 7-day rolling average of reported³ case rates increased for the week

ending 08 October 2023 compared to the previous week ending 01

October 2023 (9.7 and 8.1 per 100,000 population, respectively).

Wastewater SARS-CoV-2 levels remained relatively low and stable through September

and into October 2023.4

Hospitalisationsⁱ In the week ending 01 October 2023, the 7-day rolling average of hospital

admissions remained stable at 0.55 per 100,000 population, compared to the previous week (0.54 per 100,000 in the week ending 24 September

2023).

Mortalityⁱⁱ As of 01 October 2023, there were 713 deaths attributed to COVID-19 in

2023. There were 2,606 deaths during 2022 and 50 deaths prior to 2022.

The 7-day rolling average mortality rate was 0.02 per 100,000 population as of 01 October 2023 (six deaths over the week) compared to 0.03 per

100,000 in the previous week (11 deaths over the week).

Variants of Concern Genomics surveillance data⁵ from 18 September to 02 October 2023

showed an XBB variant called EG.5 had been slowly growing. EG.5 made up 41% of all observed cases. EG.5 was the most common tracked variant, but its growth rate had slowed in the past few weeks. This could mean that other variants were becoming competitive with EG.5, or that EG.5 had reached its limit. The rest of the cases were primarily other XBB variants (33%), with a smaller portion attributed to XBC.1.3 (14%) and other recombinants (10%). BA.2.86 variant was detected in wastewater

monitoring.

Māori

Cases The 7-day rolling average of reported case rates was 6.7 per 100,000

population for the week ending 08 October 2023, an increase compared to

the previous week, which was 5.8 per 100,000.

Hospitalisationsⁱ The 7-day rolling average rate for the week ending 01 October 2023 was

0.46 per 100,000 population, decreased compared to the previous week

(0.52 per 100,000).

Mortalityⁱⁱ As of 01 October 2023, there were 55 deaths attributed to COVID-19 in

2023. There were 240 deaths during 2022 and 15 deaths prior to 2022.

³ The proportion of infections reported as cases is unknown and may vary by factors such as age and ethnicity.

Pacific peoples

Cases The 7-day rolling average of reported case rates was 6.2 per 100,000

population for the week ending 08 October 2023, an increase compared to

the previous week, which was 5.4 per 100,000.

Hospitalisationsⁱ The 7-day rolling average rate for the week ending 01 October 2023 was

0.72 per 100,000 population, an increase compared to the previous week

(0.48 per 100,000).

Mortalityⁱⁱ As of 01 October 2023, there were 23 deaths attributed to COVID-19 in

2023. There were 150 deaths during 2022 and 4 deaths prior to 2022.

¹ Hospital admissions data provides information on hospitalisations "for" COVID-19. Data pertaining to recent trends (up to 90 days) is provisional. Admissions may be re-coded as hospitalised "with" COVID-19 and removed from the dataset.

ⁱⁱ The mortality figures are for deaths attributed to COVID-19. Recent trends should be interpreted with caution to account for death coding delays of months or years after death.
